[Award] Syntropy Phase 5 Profile & UX Implementation Report

This report outlines the implementation plan to enrich the **User Profile / Settings Segment**, introduce **Hover-Triggered Task Deletion**, and deploy research-backed **User Experience (UX) Enhancements** across the Syntropy dashboard.

1. Profile Settings Segment

To personalize the agent scheduling predictions, we will create a dedicated settings panel letting users configure their bio-parameters and daily limits.

Proposed Data Schema (`users/{userId}/profile`):

- **`focusHours`**: Daily target working window (e.g., 9:00 AM - 5:00 PM).
- **`stressThreshold`**: Max acceptable workload score before auto-rescheduling flags trigger (default 75%).
- **`ouralIntegration`**: Boolean toggle to sync sleep scores automatically.
- **`defaultRecipients`**: Default email addresses for academic professors/clients.

```
graph TD
  UI[Profile Settings Panel] -->|Save Settings| Context[AuthContext / State]
  Context -->|Sync| Firestore[(Cloud Firestore)]
  Firestore -->|onSnapshot| UI
```

2. Hover-Triggered Commitment Deletion

For a clean visual workspace, delete actions will hide by default and only display when the cursor hovers over a task card.

```
graph LR
  Hover[Hover over Task Card] -->|CSS Group-Hover| ShowTrash[Fade in Trash Icon]
  ClickTrash[Click Trash Icon] -->|Action| OptUpdate[Optimistic State Update]
  OptUpdate -->|Delete Document| FirestoreDB[(Cloud Firestore)]
```

UX Design Mechanics:

- **Positioning**: Absolute positioning on the top-right corner of the task card (`top-4 right-4`).
- **Visual Transitions**: Uses Tailwind CSS transition classes:

`opacity-0 group-hover:opacity-100 transition-opacity duration-200 ease-in-out`

-
- **Trigger Mechanism:** Emits an ``onDeleteTask(id)`` event up to the dashboard state.
-

3. UX Research & Enhancements

Based on modern web application research, we will implement three core UX practices:

A. Optimistic State Updates

When a task is deleted or added, the client UI will update **instantly** without waiting for the network round-trip to Firestore. If the database write fails, the UI will roll back to the previous state. This gives the app a zero-latency desktop feel.

B. Undo-Action Banner (Toast Notify)

Deleting a task will trigger a bottom-floating glassmorphic notification banner with a **"Undo Delete"** button. The user has 5 seconds to restore their commitment before it is permanently removed from the database.

C. Visual Stress Heatmaps

Tying the user's stress thresholds directly to the dashboard header, turning the background gradients from cyan to warm rose if the real-time load exceeds the custom setting.

4. Implementation Checklist

- [] Create profile settings state and data views.
- [] Integrate hover delete buttons with transition styles inside ``TaskCard.js``.
- [] Add ``handleDeleteTask`` Firestore delete hooks in ``page.js``.
- [] Implement bottom-floating "Undo Toast" notifier.
